# 1

## Introduction

Vanasse Hangen Brustlin, Inc. (VHB) has conducted a traffic impact and access study for the redevelopment of the Winston Florist/Nursery site located at the southwest corner of Florence Street at Route 9 in Newton, Massachusetts. The redevelopment proposal includes the demolition of the existing facilities and the construction of a Sunrise of Newton senior living facility of 85 beds. This study quantifies existing and projected future traffic conditions and identifies potential improvements within the study area. Figure 1 shows a Site location map.

## Study Methodology

This traffic assessment has been conducted in three stages. The first stage involved an assessment of existing traffic conditions within the Project area, including an inventory of existing roadway geometry, observations of traffic flow, daily and peak period traffic counts, and a review of traffic safety in the area.

The second stage of the study established the framework for evaluating the transportation impacts of the proposed Project. Specific travel demand forecasts for the Project were assessed along with future traffic demands on the study area roadways due to projected background traffic growth and other proposed area development that may occur independent of the proposed development. The year 2028 (a seven-year time horizon) was selected as the design year for analysis for the preparation of this traffic impact and access assessment, consistent with typical traffic impact studies prepared for the City of Newton and MassDOT. Analysis of area traffic operations in the year 2028 would fully reflect the effects of the proposed development as well as background traffic independent of the proposed

development. The traffic analysis conducted in the second stage identified both existing and projected future roadway capacities and demands.

The third and final stage of the study discusses possible measures to improve existing and future traffic operations in the area.

# 2

## Existing Conditions

Evaluation of the transportation impacts associated with the Project requires a thorough understanding of the existing transportation conditions in the study area including roadway geometry, traffic controls, daily and peak hour traffic flow, and traffic safety data. Each of these elements is described in detail below.

### Study Area

The key roadways in the study area are Route 9 (Boylston Street) and Florence Street. The transportation study area is based on an understanding of traffic conditions in this area and includes the following five (5) intersections:

- › Route 9 at Employee Parking Lot Driveway – *unsignalized*;
- › Route 9 at Florence Street – *unsignalized*;
- › Florence Street at North Site Driveway – *unsignalized*;
- › Florence Street at South Site Driveway – *unsignalized*; and
- › Florence Street at Tanglewood Road – *unsignalized*

The existing conditions analysis consisted of an inventory of the traffic control, roadway, driveway, and intersection geometry in the study area, the collection of daily and peak hour traffic volumes, and a review of recent crash history.

## Roadway Geometry

Descriptions of the study area roadways and intersections are included below. Figure 2 shows lane configuration and traffic control at the study intersections.

### Roadways

#### **Route 9 (Boylston Street)**

Route 9 (Boylston Street) is an east/west urban principal arterial roadway under MassDOT jurisdiction. Route 9 is a six-lane roadway (three lanes each direction), with a posted speed limit of 40 mph in the vicinity of the Project Site. Sidewalks are provided along Route 9 eastbound in the vicinity of the Site. There is no on-street parking provided along Route 9.

#### **Florence Street**

Florence Street is an urban collector roadway under City of Newton jurisdiction. It is a two-lane roadway (one lane each direction) that runs in the north-south direction in the vicinity of the Site. The posted speed limit in the vicinity of the Site is 30 MPH. Sidewalks are present along both sides of the road. Parallel on-street parking is provided on the west side (Site side) of the street and at various locations on the east side of the street under existing conditions.

### Intersections

#### **Route 9 (Boylston Street) at Parking Lot**

A parking lot, which appears to be employee parking for the existing Winston Florist, intersects Route 9 from the south to form a three-legged unsignalized intersection. The parking lot access is right-in/right-out and is under STOP-control.

#### **Route 9 (Boylston Street) at Florence Street**

Florence Street intersects Route 9 (Boylston Street) from the south to form a three-legged unsignalized intersection. Access to Florence Street is limited to right-in/right-out due to a channelized concrete island along the Florence Street approach and a median between the eastbound and westbound lanes along Route 9. Crosswalks are provided along the northbound approach to Route 9 which is under STOP-sign control. Land use near the intersection is a mix of residential and commercial.

### **Florence Street at North Site Driveway**

The north Site Driveway (Gasbarri Avenue) intersects Florence Street from the west to form a three legged unsignalized intersection. The north Site driveway consists of a single lane that is one-way entering westbound. The Florence Street northbound approach consists of a single shared left-turn/through lane while the southbound approach consists of a single shared through/right-turn lane. Land use near the intersection is a mix of residential and commercial.

### **Florence Street at South Site Driveway**

Florence Street is intersected from the south Site Driveway (Gasbarri Avenue) from the west and the Atrium Mall Driveway from the east to form a four-legged unsignalized intersection. The south Site Driveway and Atrium Mall Driveway are slightly offset from one another, with the Atrium Mall Driveway north of the south Site Driveway. The south Site Driveway consists of a single lane that is one-way exiting eastbound under STOP-control, while the Atrium Mall Driveway is one-way entering eastbound. The Florence Street northbound and southbound approaches consist of a single general-purpose lane. Land use near the intersection is a mix of residential and commercial.

### **Florence Street at Tanglewood Road**

Tanglewood Road intersects Florence Street from the west to form a three legged unsignalized intersection. Tanglewood Road consists of a single general-purpose lane under STOP-control. The Florence Street northbound approach consists of a single shared left-turn/through lane while the southbound approach consists of a single shared through/right-turn lane. The posted speed limit on Tanglewood Road is 30 mph and permit parking is allowed on both sides of the street. Land use near the intersection is a mix of residential and commercial.

### **Roadway Jurisdiction**

Roadways within the City of Newton are under the jurisdiction of the City of Newton and MassDOT. The Route 9 locations are under MassDOT jurisdiction whereas the Florence Street intersections are under local jurisdiction.

### **Existing Traffic Volumes**

Daily traffic volumes were collected on Florence Street north of Tanglewood Road over a 48-hour period on Wednesday, June 9, 2021 and Thursday, June 10, 2021 using an automatic traffic recorder (ATR). These dates represent a typical weekday for traffic count purposes (non-holidays) while schools were in session. The volumes are summarized in Table 1 and included in the Appendix to this document.

**Table 1 Existing Traffic Volume Summary**

| Location                                  | ADT <sup>a</sup> | Weekday Morning Peak Hour |                       |                         | Weekday Evening Peak Hour |          |            |
|---|------------------|---------------------------|-----------------------|-------------------------|---------------------------|----------|------------|
|   |                  | Volume                    | K Factor <sup>b</sup> | Dir. Dist. <sup>c</sup> | Volume                    | K Factor | Dir. Dist. |
| Florence Street, north of Tanglewood Road | 7,400            | 520                       | 7.0%                  | 83% SB                  | 590                       | 7.9%     | 86% SB     |

Source: VHB based on automatic traffic recorder counts conducted in June 2021 and adjusted to reflect pre COVID-19 pandemic conditions .

Note: Peak hours do not necessarily coincide with the peak hours of turning movement counts.

a. Average Daily Traffic (ADT) volume expressed in vehicles per day.

b. Represents the percent of daily traffic that occurs during the peak hour.

c. Directional distribution of peak hour traffic.

As shown in Table 1, Florence Street, north of Tanglewood Road, carries approximately 7,400 vehicles on a typical weekday with the peak hours accounting for 7.0 percent (morning peak hour) and 7.9 percent (evening peak hour) of the weekday daily traffic flow. Traffic flow along Florence Street is heavier in the southbound direction during both peak hours.

Concurrent with the ATR counts, turning movement counts (TMCs) were conducted at the study area intersections in June 2021 during the weekday morning peak period from 7:00 AM to 9:00 AM and the weekday afternoon peak period from 4:00 PM to 6:00 PM. The TMC data indicates that the weekday morning peak hour generally occurs between 8:00 AM and 9:00 AM and the weekday evening peak hour occurs between 4:45 PM and 5:45 PM.

## COVID-19 Adjustment

It should be noted that the counts for this Project were conducted in June 2021, and, while the state has returned to full capacity and pre-pandemic protocols, the effects of the COVID-19 pandemic continue to influence travel patterns across Massachusetts. To account for this, VHB determined a highly conservative 19% adjustment factor be applied to all count data. This adjustment factor was determined based on a review of nearby traffic volume counts conducted before the COVID-19 pandemic. Specifically, Route 9 eastbound volumes collected as part of the MedMen Dispensary project were reviewed.

This adjustment is believed to be highly conservative and, as such, VHB conducted the existing conditions analyses both with and without the COVID-19 adjustment factor. The results of both analyses are included in the Appendix.

## Seasonal Variation

MassDOT historical traffic counts were reviewed to understand the seasonality of traffic count data collected in the month of June. The statewide data for seasonal variation of traffic volumes indicate that traffic counts in June are generally higher than the average month. To remain conservative, the existing count data was not adjusted.

The resulting 2021 Existing peak hour traffic volume networks for the weekday morning and evening are shown in Figures 3 and 4, respectively. The MassDOT seasonal factors are included in the Appendix to this document.

## Vehicular Crash History

To identify motor vehicle crash trends in the project study area, the most current crash data for the study area intersections was obtained from MassDOT for the five-year period from 2014 through 2018. A summary of the vehicular crash data is presented in Table 2 and included in the Appendix to this document.

Crash rates are calculated based on the number of crashes at an intersection and the volume of traffic traveling through that intersection on a daily basis. MassDOT average crash rates for District 6 (the MassDOT district designation for Newton) are 0.71 and 0.52 for signalized and unsignalized intersections, respectively. In other words, on average, 0.71 crashes occurred per million vehicles entering signalized intersections, and 0.52 crashes occurred per million vehicles entering unsignalized intersections throughout District 6. The crash rate worksheets for the study area intersections are included in the Appendix to this document.

As shown in Table 2, two of the five study area intersections experienced crashes over the five-year period. The calculated crash rates at all of the intersections that experienced crashes are below the average crash rates for District 6. The majority of the crashes were rear-end, sideswipe, and single-vehicle crashes, resulting in property damage only. The intersection of Route 9 at Florence Street had two crashes involving non-motorists (bike, pedestrian). No fatal crashes were reported at any of the study area intersections.

**Table 2 Vehicular Crash Summary (2014 – 2018)**

|  | Route 9 at Dwy | Route 9 at Florence St | Florence St at North Site Dwy | Florence St at South Site Dwy | Florence St at Tanglewood Rd |
|--|----------------|------------------------|-------------------------------|-------------------------------|------------------------------|
| Signalized?                            | No             | No                     | No                            | No                            | No                           |

## **Public Transportation**

Public transportation in Newton is provided by the Massachusetts Bay Transportation Authority (MBTA). The MTBA bus route 60 travels along Route 9 and provides access to the Site. The nearest bus stops to the Site are located at The Shops at Chestnut Hill, north of the Site, and on Route 9 Eastbound approximately  $\frac{3}{4}$ -mile east of the Site. Route 60 travels between The Shops at Chestnut Hill in Newton and Kenmore Station in Boston. Connections are provided to the Green Line at Kenmore Station. Service is provided approximately every 30-40 minutes during peak hours.

The Site is also served by the D branch of the MBTA's Green Line. The D branch of the Green Line connects Newton with Brookline and Boston and travels from Riverside in Newton to Government Center in Downtown Boston. The nearest stop to the Site on the D branch of the Green Line is Chestnut Hill, an approximately 1.20-mile walk from the Site via Route 9 and Hammond Street. Service is provided approximately every 6-8 minutes during peak hours.

Public transportation route maps and schedules are provided in the Appendix to this report. While public transportation is provided near the Site, to present a conservative analysis, no credit was taken for customers or employees arriving and departing via public transportation.

# 3

## Future Conditions

To determine future roadway operations, traffic volumes in the study area were projected to the year 2028 to reflect a seven-year planning horizon from the Existing conditions consistent with City of Newton and MassDOT guidelines.

Traffic volumes on the roadway network under future conditions without the Project (No-Build) are assumed to include all existing traffic, any new traffic due to regional and area background traffic growth, and traffic related to any specific nearby development projects expected to be completed by the 2028 horizon year. Roadway improvements proposed within the boundaries of the study area were also considered and incorporated where appropriate. The anticipated traffic volumes from the proposed development were added to the No-Build traffic volumes to reflect future conditions with the Project in place (Build).

### No-Build Conditions

No-Build traffic volumes were determined by considering existing traffic volumes and adding regional traffic growth and traffic from other nearby developments. Traffic growth is a function of expected new development, changes in demographics, and changes in auto usage and ownership in the region. Regional traffic growth is projected by examining historic traffic growth trends.

### Regional Traffic Growth

Traffic studies conducted in the City of Newton and historic count data were reviewed to establish a rate at which traffic volumes can be expected to grow. A

review of recent traffic studies showed a 0.5-percent per year growth rate has been utilized. Historical count data available from MassDOT within the vicinity of the project show fluctuations in traffic volumes over the last five years, with no consistent increase or decrease in traffic volumes. Based on this research, informed by the information available, and to present a conservative analysis, a growth rate 0.5-percent per year has been assumed for this study.

## **Site Specific Growth**

In addition to accounting for background growth, the traffic associated with other planned/approved developments near the site was also considered. Based on discussions with the City of Newton, it was determined that there are four planned development projects within the vicinity of the study area that would affect traffic volumes in the vicinity of the Site.

- › **Elliot Street Dispensary:** The approved Elliot Street Marijuana Dispensary is located at 24-26 Elliot Street in Newton, Massachusetts. The redevelopment project will include the reconfiguration of a salon spa establishment and 102-seat restaurant into a marijuana dispensary with two adjacent small retail establishments. Trips associated with this development have been included as based on the May 2018 published traffic study by VHB.
- › **MEDMEN Dispensary:** There is a proposed Marijuana Dispensary located at 232 Boylston Street at the former Shreve, Crump & Low Jewelry Store in Newton, Massachusetts. The redevelopment project will include the reconfiguration of the existing building to accommodate the proposed dispensary use. Trips associated with this development have been included as based on the November 2020 published traffic study by VHB.
- › **392-202 Langley Road:** There is a proposed 20-unit residential project located at 392-303 Langley Road in Newton, Massachusetts.
- › **50 Jackson Street:** The proposed project is to be located at 50 Jackson Street in Newton, Massachusetts and will include the redevelopment of the existing commercial uses located at 383-387 Route 9 (Boylston Street), to accommodate a multifamily residential development. Trips associated with this development have been included as based on the May 2021 published traffic study by VAI.

## **Planned Roadway Improvements**

Another factor affecting background traffic conditions is the implementation of roadway improvements in the area. Currently there is just one roadway improvement project identified by the City of Newton; however, there are no current funding plans to implement the recommendations.

- › **Newton-Brookline Resurfacing and Related Work Project on Route 9:** This project is in the preliminary design phase and includes resurfacing a major portion of Route 9. The project is listed on the TIP for 2020-2024 so funding is being established.

## No-Build Traffic Volumes

The year 2028 No-Build traffic volume networks were developed by applying the 0.5-percent annual growth rate over the seven-year study horizon to the existing volume networks and adding the traffic volumes associated with the background developments described above. Figures 5 and 6 show the resulting 2028 No-Build peak hour traffic volume networks for the weekday morning and weekday evening peak hours, respectively.

## Build Conditions

Build traffic volumes were determined by estimating Site-generated traffic volumes and distributing these volumes over the study area roadways. The site generated traffic volumes include new trips that are likely to be generated by the proposed development of the property.

## Trip Generation

The rate at which any development generates traffic is dependent upon a number of factors such as size, location, and concentration of surrounding developments. As previously discussed, the proposed redevelopment plan consists of the removal of the existing Winston Florist/Nursery and construction of a new Sunrise of Newton senior living facility comprised of 85 beds. Trip generation estimates for the proposed use were projected using trip generation rates published by the Institute of Transportation Engineers (ITE) *Trip Generation, 10<sup>th</sup> Edition*<sup>1</sup>. The number of vehicle-trips generated by the existing and proposed uses were estimated based on ITE LUC 254 (Assisted Living) for occupied beds, which represents a conservative approach to traffic generation.

Table 3 summarizes the projected trip generation associated with the proposed development.

---

<sup>1</sup> Trip Generation, 10th Edition, Institute of Transportation Engineers, Washington D.C., 2017.

**Table 3 Project Trip Generation Summary**

| Time Period               | Proposed Sunrise of Newton Trips <sup>a</sup> |
|---------------------------|---|
| Weekday Daily             |   |
| Enter                     | 176   |
| <u>Exit</u>               | <u>176</u>                                    |
| Total                     | 352   |
| Weekday Morning Peak Hour |   |
| Enter                     | 10  |
| <u>Exit</u>               | <u>5</u>                                      |
| Total                     | 15  |
| Weekday Evening Peak Hour |   |
| Enter                     | 12  |
| Exit                      | <u>13</u>                                     |
| Total                     | 25  |

a. Trip Generation estimate based ITE LUC 254 (Assisted Living) for 85 Occupied Beds.

As shown in Table 3, the proposed development is estimated to generate approximately new 15 site-generated trips (10 entering/5 exiting) during the weekday morning peak hour and approximately 25 trips (12 entering/13 exiting) during the weekday evening peak hour. The trip generation worksheets are included in the Appendix to this document.

The number of vehicle trips generated by the existing Winston Florist/Nursery were estimated based on ITE land use code (LUC) 817 (Nursery Garden Center). Table 4 summarizes the estimated vehicle trips for the existing and future uses of the property.

**Table 4 Potential Credit for Winston Florist/Nursery Use**

| Time Period               | Existing Florist Trips <sup>a</sup> | Proposed Sunrise of Newton Trips <sup>b</sup> | Change in Trips |
|---------------------------|-------------------------------------|---|-----------------|
| Weekday Daily             |                                     |   |                 |
| Enter                     | 422                                 | 176   | -246            |
| <u>Exit</u>               | <u>422</u>                          | <u>176</u>                                    | <u>-246</u>     |
| Total                     | 844                                 | 352   | -492            |
| Weekday Morning Peak Hour |                                     |   |                 |
| Enter                     | 15                                  | 10  | -5              |
| <u>Exit</u>               | <u>15</u>                           | <u>5</u>                                      | <u>-10</u>      |
| Total                     | 30                                  | 15  | -15             |
| Weekday Evening Peak Hour |                                     |   |                 |
| Enter                     | 43                                  | 12  | -31             |
| <u>Exit</u>               | <u>43</u>                           | <u>13</u>                                     | <u>-30</u>      |
| Total                     | 86                                  | 25  | -61             |

a. Trip Generation estimate based ITE LUC 817 (Nursery Garden Center) for 12,400 sf.

b. Trip Generation estimate based ITE LUC 254 (Assisted Living) for 85 Occupied Beds.

As shown in Table 4, based on ITE trip generation estimates the proposed Project is expected to result in a total of 492 *fewer* trips (-246 entering/-246 exiting) on a typical weekday. The proposed Project is expected to result in a total of 15 *fewer* vehicle trips (-5 entering/-10 exiting) during the weekday morning peak hour, and 61 *fewer* vehicle trips (-31 entering/-30 exiting) during the weekday evening peak hour. The trip generation calculations are provided in the Appendix.

While the ITE trip generation estimates show a significant decrease in vehicular traffic associated with the Project Site, to present a highly conservative analysis no credit was taken for the existing use.

### Trip Distribution and Assignment

The directional distribution of traffic approaching and departing the Project is a function of several variables: population densities, existing travel patterns, and the efficiency of the roadways leading to the Site.

The assignment of Site-generated traffic to specific travel routes was based on existing traffic patterns at the study area intersections and the assumption that most motorists will seek the fastest and most direct routes to and from the Site. Existing travel patterns within the Study area were used to develop trip distribution patterns for the active adult residential use as the travel pattern in the area is generally characterized by residents commuting to/from work.

The trip distribution patterns are summarized in Table 5 and shown in Figure 7.

**Table 5 Trip Distribution Summary**

| <u>By Way Of</u>          | <u>Direction<br/>(To/From)</u> | <u>Entering<br/>Distribution</u> | <u>Exiting<br/>Distribution</u> |
|---------------------------|--------------------------------|----------------------------------|---------------------------------|
| Route 9 (Boylston Street) | East                           | 37%                              | 45%                             |
|                           | West                           | 50%                              | 50%                             |
| <u>Florence Street</u>    | <u>South</u>                   | <u>13%</u>                       | <u>5%</u>                       |
| Total                     |                                | 100%                             | 100%                            |

Source: Based on existing travel patterns.

## Build Traffic Volumes

The Site-generated traffic volumes were assigned to the roadway network according to the distribution and travel patterns described above and added to the No-Build traffic volumes to develop the peak hour Build traffic volume networks. Figures 8 and 9 present the resulting 2028 Build traffic volumes for the weekday morning and weekday evening peak hours, respectively. Site-generated traffic volume networks are included in the Appendix.

## Site Access

Based on the Site Plan (dated May 21, 2021), included in the Appendix, access to the Site would consist of 2 access driveways along Florence Street, one on the north side of the proposed building, and the primary access located on the south side of the building. The north driveway will be one-way into the Site for short term parking and drop-off/pick-up under a porte-cochere. The south driveway will be full access and used to gain access to the underground parking lot, loading dock, and dumpster. In addition, there is an existing employee parking area and driveway along Route 9 adjacent to the Site. Given the proximity of both proposed driveways to Route 9 (particularly the north driveway), sight lines will need to be improved as part of this Project. There is a cluster of vegetation that could be modified to open sight lines for both driveways.

## Sight Distance

A sight distance analysis was performed at the existing unsignalized Site driveways along Florence Street in conformance with guidelines of the American Association of State Highway and Transportation Officials (AASHTO). Sight distance considerations are generally divided into two categories: Stopping Sight Distance (SSD) and Intersection Sight Distance (ISD). Stopping Sight Distance (SSD) is the distance required for a vehicle approaching an intersection from either direction to perceive, react and come to a complete stop before colliding with an object in the road, in this case the exiting vehicle from a driveway. In this respect, SSD can be considered as the minimum visibility criterion for the safe operation of an unsignalized intersection.

Intersection Sight Distance (ISD) is based on the time required for perception, reaction and completion of the desired critical exiting maneuver once the driver on a minor street or driveway approach decided to execute the maneuver. Calculation for the critical ISD includes the time to (1) turn left, and to clear the half of the intersection without conflicting with the vehicles approaching from the left; and (2) accelerate to the operating speed of the roadway without causing approaching vehicles to unduly reduce their speed. In this context, ISD can be considered as a desirable visibility criterion for the safe operation of an unsignalized intersection. Essentially, while SSD is the minimum distance needed to avoid collisions, ISD is the minimum distance needed so that mainline motorists will not have to substantially reduce their speed due to turning vehicles. To maintain the safe operation of an unsignalized intersection, ISD only needs to be equal to the stopping sight distance, though it is desirable to meet ISD requirements by themselves.

To calculate the required SSD and ISD at the unsignalized Site driveways, the speed limit along Florence Street was used for this preliminary assessment (30 MPH).

Table 6 summarizes the sight distance analysis based on field measurements conducted by VHB. The sight distance worksheets are included in the Appendix.

**Table 6    Sight Distance Analysis Summary**

| Location   | Stopping Sight Distance <sup>a</sup> |          |          | Intersection Sight Distance <sup>a</sup> |         |                  |
|--|--------------------------------------|----------|----------|--|---------|------------------|
|  | Traveling                            | Required | Measured | Looking                                  | Desired | Measured         |
| Florence Street at north Site driveway (enter-only) <sup>b</sup> | Northbound                           | 195      | 220      | N/A                                      | NA      | NA               |
|  | Southbound                           | 220      | 110      | N/A                                      | NA      | NA               |
| Florence Street at south Site driveway                           | Northbound                           | 190      | 250      | Left                                     | 335     | 250              |
|  | Southbound                           | 210      | 250      | Right                                    | 335     | 230 <sup>a</sup> |

Based-on guidelines established in A Policy on the Geometric Design of Highways and Streets, Sixth Edition, American Association of State Highway and Transportation Officials (AASHTO), 2011 for the posted speed limit 30 mph.

a      Sight distance is visible to/from the intersection of Route 9 (Boylston Street)

b      Intersection Sight Distance is not applicable at the North Site driveway due to its directionality as an enter-only driveway

As shown in Table 6, the minimum stopping sight distance requirement is met traveling northbound at the north Site driveway. The minimum stopping sight distance is also met in both the northbound and southbound directions at the south Site driveway. The proximity of the north driveway to Route 9 limits the stopping sight distance in the southbound direction but vehicles that would enter Florence Street from Route 9 eastbound would be slowing down to make that maneuver.

The minimum intersection sight distance is not met at the South Site driveway looking left or right. However, again, due to the proximity of the north driveway to Route 9 the intersection sight distance looking left is limited. Additionally, it should be noted that while intersection sight distance is not met at the south driveway looking left, the measured intersection sight distance does allow for a left-turning vehicle to see to the intersection of Florence Street at Route 9. To ensure that the sight lines are opened and maintained for this Project, the vegetation to the north of the north Site driveway should be trimmed/removed to allow the maximum sight

lines in this area. It should be noted that intersection sight distance is not applicable to the North Site driveway since this driveway is currently an enter-only driveway and will remain as such under all future conditions, with or without the Project in place. In addition, to improve/maintain sight distance at both Site driveways, on-street parking between the driveways and just south of the south driveway should be eliminated.

# 4

## Traffic Operations Analysis

Measuring existing traffic volumes and projecting future traffic volumes quantifies traffic within the study area. To assess quality of flow, roadway capacity analyses were conducted with respect to the 2021 Existing conditions and projected 2028 No-Build and 2028 Build traffic volume conditions. Capacity analyses provide an indication of the adequacy of the roadway facilities to serve the anticipated traffic demands. All capacity analyses are contained in the Appendix to this document.

### **Level-of-Service and Delay Criteria**

Level-of-service (LOS) is the term used to denote the different operating conditions that occur on a given roadway segment under various traffic volume loads. It is a qualitative measure of the effect of a number of factors including roadway geometrics, speed, travel delay, freedom to maneuver, and safety. Level-of-service provides an index to the operational qualities of a roadway segment or an intersection. Level-of-service designations range from A to F, with LOS A representing the best operating conditions and LOS F representing the worst operating conditions.

For signalized intersections, the evaluation criteria used to analyze study area intersections are based on the percentile-delay method (Synchro results). For unsignalized intersections, the analysis assumes that traffic on the mainline is not affected by traffic on the side streets. The level of service is only determined for left turns from the main street and all movements from the minor street. The evaluation

criteria used to analyze unsignalized intersections are based on the Highway Capacity Manual (HCM), 6<sup>th</sup> Edition<sup>2</sup>.

It should be noted that the analytical methodologies typically used for the analysis of unsignalized intersections use conservative analysis parameters such as high critical gaps. Actual field observations indicate that drivers on minor streets generally accept smaller gaps in traffic than those used in the analysis procedures and therefore experience less delay than reported by the analysis software. The net effect of these procedural limitations of the analysis software is the over-estimation of calculated delays at unsignalized intersections. Cautious judgment should therefore be exercised when interpreting the capacity analysis results at unsignalized intersections.

## **Intersection Capacity Analysis**

Intersection capacity analyses were conducted at all intersections in the study area. Analyses were conducted for the 2021 Existing, 2028 No-Build and 2028 Build conditions. Table summarizes the capacity analyses for the study area unsignalized intersections. The capacity analyses results are included in the Appendix to this document.

As shown in Table 7, operations at all study area intersection are not expected to be impacted by the proposed Project traffic. The intersection of Route 9 at Florence Street currently operates at LOS F and will continue to do so under all future conditions, with or without the Project in place.

The eastbound exiting south Site Driveway movement currently operates at LOS B during both peak hours and is expected to remain at LOS B under all future conditions, with or without the Project in place.

a Demand

b Volume to capacity ratio.

c Average total delay, in seconds per vehicle.

d Level-of-service.

e 95th percentile queue, in feet.

# 95th percentile volume exceeds capacity, queue may be longer.

# 5

## Mitigation

As outlined above, the proposed development Project is expected to have very minor impacts on traffic conditions in the study area. However, the Proponent proposes to implement Transportation Demand Management (TDM) measures on Site.

### Transportation Demand Management (TDM)

Given the Site's proximity to numerous MBTA bus stops, there are strong opportunities to implement Transportation Demand Management (TDM) measures on site to minimize the proposed project's impacts on the surrounding roadways. Implementation of TDM measures will offer alternatives to traveling in single occupancy vehicles, which will reduce traffic and parking demand on the site. As part of the proposed project, the following TDM measures will be implemented on site:

- › Display all public transit schedules in a central location within the facility;
- › To promote pedestrian safety, a map of the area will be provided for transit users that displays the location of MBTA train stations, MBTA bus stops, sidewalks, and crosswalks. This information will be distributed to employees and will also be posted in common areas;
- › Provide a secure bicycle storage area on site; and
- › Implement an onsite car-pool rideshare program with guaranteed ride home.

# 6

## Conclusion

VHB, Inc. has prepared a traffic impact and access study (TIAS) for the proposed Sunrise of Newton development, which will replace the former Winston Florist/Nursery which exists on the Site today. Access to the Site would consist of 2 access driveways, one on the north side of the proposed building (enter only), and the primary access for all other activities located on the south side of the building. The south driveway would provide access and egress for all non-delivery activities, with a circular driveway leading to the building entrance under a porte-cochere.

Based on a review of the anticipated trip generation and trip distribution for the proposed project, a study area was established, and includes the following five intersections:

- › Route 9 at Employee Parking Lot Driveway
- › Route 9 at Florence Street
- › Florence Street at North Site Driveway
- › Florence Street at South Site Driveway
- › Florence Street at Tanglewood Road

Turning movement counts (TMC), collecting peak hour data, were conducted at each of the study area intersections during the weekday morning peak period from 7:00 AM to 9:00 AM and weekday evening peak period from 4:00 PM to 6:00 PM in January 2017. Concurrent with the TMCs, a 48-hour automatic traffic recorder (ATR) counts was conducted at Florence Street, north of Tanglewood Road.

Based on ITE trip generation estimates, the proposed Project is expected to result in a total of 492 *fewer* trips per day (vpd) on a typical weekday. The proposed Project is expected to result in a total of 15 *fewer* vehicle trips (-5 entering/-10 exiting) during the weekday morning peak hour, and 61 *fewer* vehicle trips (-31 entering/-30 exiting) during the weekday evening peak hour. While the ITE trip generation estimates show a significant decrease in vehicular traffic associated with the Project Site, to present a highly conservative analysis no credit was taken for the existing Winston Florist/Nursery use.

Detailed traffic analyses indicate that all of the study area intersections will continue to operate at the same level of service as existing conditions under all future conditions, with or without the Project in place. Although the proposed development is projected to have minimal effect on area traffic operations, the proponent is committed to this community and as such is proposing the following improvement upon approval of the proposed Project:

- › On-site Transportation Demand Management (TDM) program to promote alternative modes of transportation and reduce traffic and parking demands for the site.

Overall, the study finds that Site generated traffic will not have a significant effect on traffic operations within the study area and that the existing transportation infrastructure in the area, in conjunction with the proposed improvements, can adequately accommodate the traffic volumes projected to be generated by the proposed development.

## Appendix

- › Traffic Count Data
- › Seasonal Adjustment Factors
- › Crash Data
- › Public Transportation
- › Trip Generation
- › Site Plan
- › Sight Distance
- › Synchro Capacity Analysis
  - No COVID-19 Adjustment – Existing Conditions Only
  - COVID-19 Adjustment – All Conditions

## Traffic Count Data

This page contains traffic count data for various locations. The data is presented in a table format.

| Location       | Count Type       | Value |
|----------------|------------------|-------|
| Intersection A | Car Count        | 1200  |
| Intersection A | Bike Count       | 100   |
| Intersection A | Pedestrian Count | 200   |
| Intersection B | Car Count        | 1500  |
| Intersection B | Bike Count       | 120   |
| Intersection B | Pedestrian Count | 250   |
| Intersection C | Car Count        | 1800  |
