Stimulus Payments: Spending, Savings, or Both?

About three out of five Americans who received COVID-19 stimulus payments used the funds to make purchases or pay bills, which was consistent with the federal government's intention to stimulate the economy. However, many people used at least part of the funds to improve their overall financial position by building savings or paying down debt.

Debt Optimization Strategies

To help improve your financial situation, you might consider reducing your debt. Before starting any debt payoff strategy (or combination of strategies), be sure you understand the terms of your debts, including interest rates, payment requirements, and any prepayment or other penalties.

Start with Understanding Minimum Payments

You are generally required to make minimum payments on your debt, based on factors set by the lender. Failure to make the minimum payments can result in penalties, higher interest rates, and default. If you make only the minimum payments, it may take a long time to pay off the debt, and you will have to pay more interest over the life of the loan. This is especially true of credit-card debt.

Your credit-card statement will indicate your current monthly minimum payment. To find the factors used in calculating the minimum payment amount each month, you can review terms in your credit-card contract, which can change over time.

The minimum payment for credit cards is usually equal to the greater of a minimum percentage multiplied by the card's balance (plus interest on the balance, in some cases) or a base minimum amount (such as \$15). For example, assume you have a credit card with a current balance of \$2,000, an interest rate of 18%, a minimum percentage of 2% plus interest, and a base minimum amount of \$15. The initial minimum payment required would be \$70 [greater of $(\$2,000 \times 2\%) + (\$2,000 \times (18\% \div 12))$ or \$15]. If you made only the minimum payments (as recalculated each month), it would take 114 months (almost 10 years) to pay off the debt, and you would pay total interest of \$1,314. For consumer loans, the minimum payment is generally the same as the regular monthly payment.

Make Additional Payments

Making payments in addition to your regular or minimum payments can reduce the time it takes to pay off your debt and the total interest paid. Additional payments could be made periodically, such as monthly, quarterly, or annually.

Using the previous example (\$70 initial minimum payment), if you made monthly payments of \$100 on the credit card debt, it would take only 24 months to pay off the debt, and total interest would be just \$396.

Here's another example. Assume you have a current mortgage balance of \$300,000. The interest rate is 5%, the monthly payment is \$2,372, and the remaining term is 15 years. If you make regular payments, you will pay total interest of \$127,029. However, if you pay an additional \$400 each month, it will take only 12 years and one month to pay off the mortgage, and you will pay total interest of just \$99,675.

Pay Off Highest Interest-Rate Debt First

One way to potentially optimize payment of your debt is to first make the minimum payments required for each debt and then allocate any remaining dollars to debt with the highest interest rates.

For example, assume you have two debts, you owe \$10,000 on each, and each has a monthly payment of \$200. The interest rate for one debt is 8%; the interest rate for the other is 18%. If you make regular payments of \$400, it will take 94 months until both debts are paid off, and you will pay total interest of \$10,827. However, if you make monthly payments of \$600, with the extra \$200 paying off the debt with an 18% interest rate first, it will take only 41 months to pay off the debts, and total interest will be just \$4,457.

Pay Off Highest Interest-Rate Debt First

Use a Debt-Consolidation Loan

If you have multiple debts with high interest rates, it may be possible to pay them off with a debt-consolidation loan. Typically, this will be a home-equity loan with a lower interest rate than the rates on the debts being consolidated. (Note that a federal income tax deduction is not currently allowed for interest on home-equity indebtedness unless it is used to substantially improve your home.) Keep in mind that a home equity-loan potentially puts your home at risk because it serves as collateral, and the lender could foreclose if you fail to repay. There also may be closing costs and other charges associated with the loan.

All examples are hypothetical and used for illustrative purposes only and do not represent any specific investments or products. Fixed interest rates and payment terms are shown, but actual interest rates and payment terms may change over time. Actual results will vary.

When Should Young Adults Start Investing for Retirement?

As young adults embark on their first real job, get married, or start a family, retirement might be the last thing on their minds. Even so, they might want to make it a financial priority. In preparing for retirement, the best time to start investing is now — for two key reasons: compounding and tax management.

Power of Compound Returns

A quick Internet search reveals that Albert Einstein once called compounding "the most powerful force in the universe," "the eighth wonder of the world," or "the greatest invention in human history." Although the validity of these quotes is debatable, Einstein would not have been far off in his assessments.

Compounding happens when returns earned on investments are reinvested in the account and earn returns themselves. Over time, the process can gain significant momentum.

For example, say an investor put \$1,000 in an investment that earns 5%, or \$50, in year one, which gets reinvested, bringing the total to \$1,050. In year two, that money earns another 5%, or \$52.50, resulting in a total of \$1,102.50. Year three brings another 5%, or \$55.13, totaling \$1,157.63. Each year, the earnings grow a little bit more.

Over the long term, the results can snowball. Consider the examples in the accompanying chart.

A Head Start Can Be a Strong Ally

This chart illustrates how much an investor could accumulate by age 65 by investing \$3,000 a year starting at age 25, 35, and 45 and earning a 6% annual rate of return, compounded annually.

These hypothetical examples of mathematical compounding are used for illustrative purposes only and do not reflect the performance of any specific investments. Fees, expenses, and taxes are not considered and would reduce the performance shown if they were included. Rates of return will vary over time, particularly for long-term investments. Investments offering the potential for higher rates of return also involve a higher degree of investment risk. Actual results will vary.

Tax Management

Another reason to start investing for retirement now is to benefit from tax-advantaged workplace retirement plans and IRAs.

Lower taxes now. Contributions to traditional 401(k)s and similar plans are deducted from a paycheck before taxes, so contributing can result in a lower current tax bill. And depending on a taxpayer's income, filing status, and coverage by a workplace plan, contributions to a traditional IRA may result in an income tax deduction.

Tax-deferred compounding. IRAs and workplace plans like 401(k)s compound on a tax-deferred basis, which means investors don't have to pay taxes on contributions and earnings until they withdraw the money. This helps drive compounding potential through the years.

Future tax-free income. Roth contributions to both workplace accounts and IRAs offer no immediate tax benefit, but earnings grow on a tax-deferred basis, and qualified distributions are tax-free. A qualified distribution is one made after the Roth account has been held for five years and the account holder reaches age 59½, dies, or becomes disabled.

Saver's Credit. In 2022, single taxpayers with adjusted gross incomes of up to \$34,000 (\$66,000 if married filing jointly) may qualify for an income tax credit of up to \$1,000 (\$2,000 for married couples) for eligible retirement account contributions. Unlike a deduction — which helps reduce the amount of income subject to taxes — a credit is applied directly to the amount of taxes owed.

Avoiding penalties. Keep in mind that withdrawals from pre-tax retirement accounts prior to age 59½ and nonqualified withdrawals from Roth accounts are subject to a 10% penalty on top of regular income tax.

Additional Fuel for the Fire

Workplace plans that offer employer matching or profit-sharing contributions can further fuel the tax-advantaged compounding potential. Investors would be wise to consider taking full advantage of employer matching contributions, if offered.

Don't Delay

With the power of compounding and the many tax advantages, it may make sense to make retirement investing a high priority at any age.

The Inflation Experience Is Painful and Personal

Inflation is a sustained increase in prices that reduces the purchasing power of your money over time. According to the Consumer Price Index (CPI), inflation peaked at an annual rate of 9.1% in June 2022, the fastest pace since 1981, before ticking down to 7.7% in October.¹

The CPI tracks changes in the cost of a market basket of goods and services purchased by consumers. Items are sorted into more than 200 categories and weighted according to their "relative importance," a ratio that represents how consumers divide up their spending, on average. Basic needs such as shelter (33%), food (14%), energy (8%), transportation (8%), and medical care (7%) account for about two-thirds of consumer expenditures. Because the CPI is a comprehensive measure of prices across the U.S. economy, the index also contains many items that an individual consumer may purchase infrequently, or not at all.

Wide variations in spending patterns help explain why some consumers feel the sting of inflation more than others. This means that the extent to which you experience inflation depends a lot on where you live, as well as your age, health, income, family size, and lifestyle. In effect, your personal inflation rate could be significantly higher or lower than the average headline inflation rate captured in the CPI. Consider the following examples.

- In October 2022, the 12-month increase in the cost of shelter was 6.9%.² Shelter carries the most weight of any category in the CPI, which made fast-rising home prices and rents a top driver of inflation over the previous year. A first-time homebuyer, or a renter who signs a new lease, is likely to feel the full impact of these hefty price increases. However, a homeowner with a fixed-rate mortgage is generally insulated from these rising costs and might even benefit financially from home-equity gains.
- Gasoline surged 17.5% during the 12 months ended in October 2022.³ Individuals who rarely drive, possibly because they are retired or work remotely, might have been able to shrug off the price spike. But for drivers with long commutes, filling up the gas tank regularly might have put a sizable dent in their households' finances, in some cases forcing them to cut back on other purchases.
- Food and beverage prices rose 10.9% over the same 12-month period, a trend that clearly affects everyone.⁴ But rising food costs tend to put more pressure on the budgets of lower-income households because they spend a greater share of their income on necessities and typically have smaller financial cushions. Plus, shoppers can't easily switch to lower-cost options if they are already relying on them.⁵
